

AN: PAT 2001-341544
TI: Information acquisition display procedure for WWW, involves combining portion of formatted updated data of document with remaining data of document
PN: **JP2001109715-A**
PD: 20.04.2001
AB: NOVELTY - A portion of updating data of a document is stored in XML format in XML data server (130). The document is displayed by the client using world wide web (WWW) browser. By designating a portion of displayed document, updated XML format data is acquired and analyzed. The analyzed data is combined with remaining data of the document and displayed. DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following: (a) Client apparatus; (b) Information providing server of WWW client-server system; USE - For information acquisition and display in world wide web (WWW). ADVANTAGE - Since XML data server stores only the updating data, load on the network, is reduced and thereby required data is managed efficiently. DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of the client-server system. (Drawing includes non-English language text). XML data server 130
